

CONNECT³

THE MULTI-UTILITY SPECIALIST

Delivering integrated utility solutions across residential, industrial & commercial developments

By coordinating all utility services from design through to connection, we reduce complexity, manage risk and help our clients deliver high-quality, future ready projects on time and on budget.

Who are Connect3?

Connect3 are a multi-utility provider delivering fully integrated utility infrastructure across residential, industrial and commercial developments.

With a strong focus on quality, safety and regulatory compliance, we provide specialist expertise across established and emerging utility networks.

Our coordinated, end-to-end delivery model reduces programme risk, ensures technical assurance and supports predictable outcomes from design through to final connection.

The advantages of an experienced multi-utility provider

The advantages of delivering your utility requirements through a single, experienced multi-utility provider are extensive, with simplicity, efficiency and consistency at the core of our approach.

From initial engagement and detailed design through to construction and final delivery, you'll work with a coordinated team of multi-utility specialists. This integrated approach streamlines communication, reduces risk and saves valuable time, allowing you to focus on the wider challenges of delivering high-quality, sustainable developments.

We are accredited for...

What we offer...

Gas

As a GIRS accredited Utility Infrastructure Provider (UIP), we offer extensive expertise in the design, installation and connection of all gas network pressures.

Our scopes also include the construction of multi-utility buildings (CMOB), providing integrated solutions for complex utility requirements.

Electric

As a NERS accredited Independent Connections Provider (ICP), we deliver high-quality electrical infrastructure solutions.

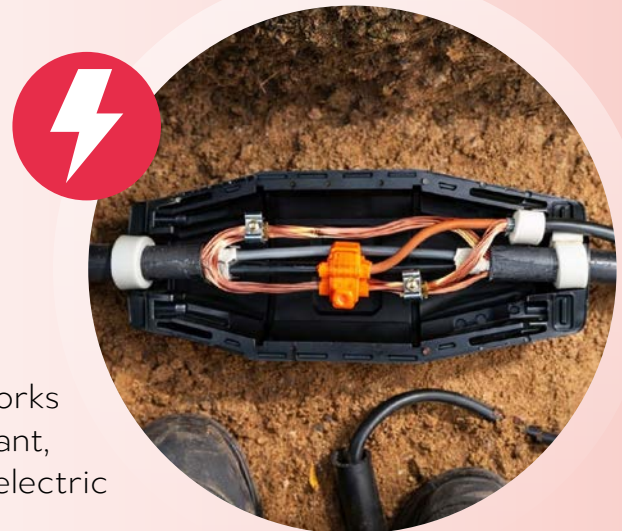

Accredited to install electricity distribution networks up to and including 33kV, we provide fully compliant, future-ready networks, including the delivery of electric vehicle (EV) charging infrastructure.

Water

We are accredited by the Water Industry Registration Scheme (WIRS) to deliver high-quality water infrastructure, including design co-ordination, installation, testing and commissioning of new water networks.

As a self-lay provider (SLP), our work meets the standards required for adoption by either an Independent Water Company (New Appointments and Variations – NAV) or the local incumbent water utility.

What we offer...

Civils

We work closely with clients and local authorities to design and install networks in the public highway that are cost-effective and minimally disruptive. Safety, training and compliance are central to our approach and all works are delivered in accordance with statutory requirements and best practice guidance.

By keeping all core civils capabilities in-house and working closely with trusted traffic management contractors, we provide a seamless service that integrates with our multi-utility offering, coordinating the delivery of gas, water, electricity and other essential services efficiently, safely, and sustainably.

Feasibility

From early project planning through to final utility connection, we work alongside you to navigate regulatory, technical and routing challenges. We obtain Statutory Undertaker Points of Connection and determine electrical connection requirements through self-determined solutions, managing the process from initial assessment through to approved design and delivery.

Our early-stage feasibility assessments include, route reviews, trial holes, utility surveys and ground penetrating radar (GPR), supported by engagement with local authorities and statutory undertakers.
